Eprahem Yhya

BOT & WEB DEVELOPER

Gaza, Palestine · Remote eprahemyhya45@gmail.com +970 597 448 626

github.com/eprahem-yhya

I build two things: automation that runs unattended, and web pages people remember. On the automation side it is Python bots wired into real systems — Telegram, trading platforms, databases — where the hard part is not writing the feature but keeping it correct at three in the morning with nobody watching. On the web side it is polished, responsive front ends, built with the same care and shipped to production.

SELECTED WORK

Automated Trading System

PRIVATE SOURCE

See the control panel

An end-to-end pipeline that reads trading signals from Telegram, classifies them with an AI model, and executes them on MetaTrader 5. My own concept, built from scratch and developed continuously over four months.

- Classifies every incoming message into one of fifteen intents — new order, stop-loss move, partial close, cancellation — and forwards only what is executable.
- Refuses unsafe instructions by design: an order whose stop sits on the wrong side of entry is rejected, and a request to remove a stop is never obeyed.
- Web dashboard on FastAPI with a React front end, reading a shared SQLite database in WAL mode alongside the live bot.
- Three-layer access: bcrypt password, one-time code over Telegram, then a signed session cookie. Reachable remotely through a Cloudflare tunnel.
- Watchdog and heartbeat monitoring, scheduled backups, and automated weekly performance reports.
- The control panel is published as a read-only preview: real interface, generated data, inert controls — the source stays private.

Python · Telethon · MetaTrader5 API · Gemini API · FastAPI · React · SQLite · Cloudflare Tunnel

XMIND — Private Community Platform

LIVE, MEMBERS ONLY

See the sign-in page

A private social network for one closed community of twenty to sixty people: teams, a members directory, profiles with skills, and a feed of posts, photos, comments and mentions. Built with one partner; I wrote the feed and most of the screens, and I run everything after the code — the server, deployments and backups.

- Nobody walks in: an account exists only through an invite, a newcomer joins a team only when its leader accepts, and every action is checked on the server against two role ladders — founder, admin and member across the site; leader, co-leader and member inside a team.
- Passwords hashed with Argon2, 30-day sessions in an HttpOnly cookie, rate-limited sign-in, and one-time reset links.
- Photos are resized and recompressed on upload and served through a route that applies the visibility rule of the post they belong to, so a team-only picture never leaks by its URL.
- Mentions with group tags — @team, @leaders, @everyone — whose reach follows the writer's role, and replies to comments threaded two levels deep.
- Arabic and English with full right-to-left layout, light and dark themes, and an Android app that wraps the same site.
- Self-hosted on a Windows server behind Caddy with automatic HTTPS: only ports 80 and 443 are open, the app restarts itself if it stops, and a full backup lands in Telegram every night.
- Over 150 unit tests and an end-to-end suite that builds the app and drives it through a browser, run before every deploy.

TypeScript · Next.js · React · Node.js · SQLite · Argon2 · sharp · Caddy

QR Menu & Table Ordering — Android and Windows

PRODUCT, SOLD TO RESTAURANTS

See the screens

A complete QR menu and table-ordering system for restaurants that needs no server, no hosting, no subscription and no internet. Menu, ordering, the captain's screen, kitchen printing and the till bill all run inside one Android app on a phone in the restaurant — or, in the Windows edition, on the cashier's PC.

- The phone is the server: an HTTP server inside the app serves the menu to guests over the restaurant's own WiFi, so service survives an internet outage.
- Guests scan the QR on the table and order from the browser — nothing to install; the captain confirms each order before the kitchen sees it.
- Prints to ESC/POS thermal printers per station — grill, bar, till — each getting only its own lines, with Arabic shaped correctly on paper.
- Arabic or English chosen at setup: every screen, message, printed ticket and QR card follows, and a guest can still switch the menu for themselves.
- Money handled in whole minor units, so the day's report reconciles against the cash drawer exactly.
- Over ninety instrumented tests on a real Android device in CI, including one that plays a whole evening through and checks the night's takings, and a run that photographs every screen.
- Sold as a finished product with a four-day trial and per-device activation, so a buyer works a real evening on it before paying.
- Windows edition: the same screens served by a Python port of the server, shipped as a single .exe with a tray icon — the cashier sees the full itemised bill on the PC, the captain manages orders from a phone over the LAN, and the roles are enforced server-side. Same database schema and activation, so a phone backup restores on the PC.

AMBER — Coffee House View live

A landing page built around a scroll-driven 3D scene: a coffee bean turns and rises, a porcelain cup grows into its place, steam lifts once there is something to rise from.

- Every asset is generated in the browser — the latte art and particle sprites are drawn to a canvas at runtime, so the page ships no images.
- Environment-mapped reflections and filmic tone mapping, which is what separates a 3D object from a photograph.
- Full English / Arabic switching with RTL layout, without a reload or a second page.
- Degrades on purpose: no WebGL, a reduced-motion preference, or a low-memory device gets a static composition instead of a page that stutters.
- One HTML file, no build step, no framework.

Three.js · JavaScript modules · CSS · GitHub Pages

MAISON NOOR — Storefront View live

A luxury fragrance storefront with a photoreal 3D hero and a working cart, built as one static page.

- A real glTF bottle rendered with true glass transmission and refraction, lit by an HDRI environment map so every highlight reflects an actual place.
- The brand label is drawn to a canvas at runtime and mapped onto the model — what stops a licensed asset from looking licensed.
- Cart with size variants, quantity, live totals and badge count; the drawer traps focus, restores it on close, and closes on Escape.
- Palette, type pairing and motion tier resolved from a design-intelligence dataset rather than chosen by eye.
- Bilingual EN / AR including drawer direction, 44px minimum targets, visible focus, and motion disabled on request.
- Built on the commerce side too: I trained in e-commerce and sold on eBay, so the storefront is shaped around how a listing actually converts, not only how it looks.

Three.js · glTF · HDRI lighting · JavaScript · CSS · GitHub Pages

Channel Mirror COMPANION TOOL

A Telegram client that mirrors messages from an external source into a channel I control, including edits and deletions, so downstream systems read from one predictable place instead of a feed I cannot govern.

Python · Telethon · SQLite

TECHNICAL SKILLS

LANGUAGES

Python, Kotlin, TypeScript, JavaScript, SQL, HTML, CSS

AUTOMATION

Telegram Bot API, Telethon, MetaTrader 5 API, scheduled and long-running services

MOBILE & DESKTOP

Android (Kotlin), embedded HTTP server, WebView, instrumented testing on device; Windows desktop apps in Python (PyInstaller, tray, WebView2)

WEB

Next.js, React, Node.js, FastAPI, Three.js, responsive and RTL layout; self-hosting behind Caddy with automatic HTTPS

DATA

SQLite (WAL, concurrent readers), schema design, reporting

PRACTICE

Git, CI on GitHub Actions, structured logging, watchdogs and health checks, API integration

EDUCATION

BSc, Computer Information Systems

Third year · Expected 2027–2028

Programming Diploma Year

Completed before the degree

E-commerce Training

Gaza, 2023 · followed by selling on eBay

LANGUAGES

Arabic

Native

English

Intermediate — written and technical communication

Available for freelance and contract work — remote. Paid in USDT.
