Eprahem Yhya

BOT & WEB DEVELOPER

Gaza, Palestine · Remote eprahemyhya45@gmail.com +970 597 448 626 Telegram: @EprahemDevBot github.com/eprahem-yhya

Python developer who builds automation that runs unattended, and the web front ends around it. My main project is a trading system that reads a private signal channel, classifies each message, and executes it on MetaTrader 5 with strict risk rules. Verified seller on MQL5.com, open to MetaTrader 5 work: Expert Advisors and trade copiers.

SELECTED WORK

Automated Trading System

PRIVATE SOURCE · See the control panel · See the product page

An end-to-end pipeline that reads trading signals from Telegram, classifies them with an AI model, and executes them on MetaTrader 5. My own concept, built from scratch and developed continuously over four months.

- Reads a private signal channel through the Telegram API and, as a second path, through Telegram Web (Playwright + Chrome DevTools Protocol). Classifies each message into one of fifteen intents and forwards only what is executable.
- Executes on MT5 with partial closes, break-even, a stop that trails one target behind, end-of-day close by server clock, risk caps, and rejection of any order whose stop is on the wrong side of entry. A request to remove a stop is never obeyed.
- Mirrors channels to other channels through a bot, including edits and deletions.
- Tick-level backtest in Python (NumPy) of 261 historical signals over five weeks, used to choose the exit rules.
- Runs on a Windows VPS and heals itself: a scheduled watchdog restarts failed services and alerts on a stale feed; sessions are backed up daily; a position-size rule is applied once per trading day; a weekly report is sent. 50+ unit tests cover the trading engine.
- FastAPI and React dashboard on a shared SQLite database (WAL), behind bcrypt, a one-time Telegram code and a signed cookie. A read-only preview is public; the source stays private.

Python · Telethon · Playwright · MetaTrader5 API · NumPy · Gemini API · FastAPI · React · SQLite

XMIND — Private Community Platform

MEMBERS ONLY

A private social network for one closed community of twenty to sixty people, built with one partner. I wrote the feed and most screens, and I run the server, deployments and backups.

- Invite-only accounts and two server-checked role ladders (site and team). Argon2 passwords, HttpOnly sessions, rate-limited sign-in, and photos served through the visibility rule of their post.
- Arabic and English with full RTL, an Android wrapper app, self-hosted behind Caddy with automatic HTTPS and a nightly backup to Telegram.
- Over 150 unit tests plus an end-to-end browser suite, run before every deploy.

TypeScript · Next.js · React · Node.js · SQLite · Argon2 · Caddy

QR Menu & Table Ordering — Android and Windows

PRODUCT, SOLD TO RESTAURANTS · See the screens

A QR menu and table-ordering system that needs no server, hosting or internet: an HTTP server inside the Android app serves guests over the restaurant's own WiFi.

- Guests order from the browser; the captain confirms; ESC/POS thermal printers print per station, with Arabic shaped correctly. Money is kept in whole minor units so the day's report matches the cash drawer.
- Over ninety instrumented tests on a real device in CI. Windows edition: a Python port shipped as a single .exe, with the same database schema.

Kotlin · Android · NanoHTTPD · Python · SQLite · ESC/POS · PyInstaller · GitHub Actions

Two 3D web demos

AMBER, coffee house · MAISON NOOR, storefront

Single-file Three.js pages: a scroll-driven scene drawn with no image assets, and a fragrance storefront with a glTF bottle and a working cart. Both are bilingual EN / AR with RTL, and fall back to a static view without WebGL or with reduced motion.

TECHNICAL SKILLS

LANGUAGES
Python, Kotlin, TypeScript, JavaScript, SQL, HTML, CSS

AUTOMATION & TRADING
Telegram Bot API, Telethon, Playwright, MetaTrader 5 API, tick-level backtesting (NumPy), watchdogs, MQL5 marketplace

WEB & MOBILE
Next.js, React, Node.js, FastAPI, Three.js, Android (Kotlin), RTL layout, Caddy

PRACTICE
SQLite, Git, CI on GitHub Actions, unit and end-to-end tests, Windows VPS operations

EDUCATION & LANGUAGES

BSc, Computer Information Systems
Third year · Expected 2027–2028 · programming diploma year completed before

E-commerce Training
Gaza, 2023 · followed by selling on eBay

Arabic · English
Native · Intermediate, strong in written and technical English
